

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

to do any more; for the Dimensions of themselves are purely arbitrary. If you have a clear Idea of the Construction of the Machine by this general Description, it is all I have aimed at.

XV. *Extract of a Letter from the Marquis Nicolini F. R. S. to the President, concerning the same Mirror burning at 150 Feet Distance.*

S I R,

\* \* \*

Read April 30. 1747. YOU know that the Affair of *Archimedes* setting the *Roman* Fleet on Fire by means of Burning Glasses, has been look'd upon as a Thing impossible and romantic. *Descartes* positively denied the Fact, which had been believed for so many Ages; and our modern Philosophers, after many Trials, and various Reasonings, have been of the same Opinion. But M. *de Buffon*, being asked if it might be possible to invent a *Phaometer*, or *Mackine* for measuring the *Intensity* of *Light*, hath discovered by Trial, that *Light* was able to produce great Effects in a *Focus* at a great Distance, if one made use of a great Number of Disks, which would reflect so many Images of the Sun, and fling them all into one Place. He put together therefore a sort of *Polyedron*, consisting of 168 small Mirrors, or flat Pieces of Looking-glass, each 6 Inches square; by means of which, with the faint Rays of the Sun, in the Month of *March*, he set on Fire some Boards  
of

of Beech Wood at 150 Feet Distance. By increasing the Numbers of Mirrors, he hopes to be able to do the same 900 Feet off.

His Machine has besides, the Conveniency of burning downwards or horizontally, as one pleases; and it burns either in its greater *Focus*, or in any nearer Interval, which our commonly known Burning Glasses have not, their *Focus* being fix'd and determined.

Perhaps this Machine may afford a Manner of measuring either Light, or the different Degrees of Heat of burning Bodies. The Difficulty is to find the Method of marking the Degrees, and of fixing a Point of Comparison; for the Point of kindling will not determine it; because that chiefly depends upon the greater or less Degree of Inflammability of different combustible Bodies.

Mr. *Maupertuis*, in a Letter to the *President*, dated at *Potzdam*, May 20. 1747. says, that his Friend *Buffon* has recover'd the Burning-Glasses of *Archimedes*; that with 168 plane Glasses, each 6 Inches square, he has melted a silver Plate, at the Distance of 60 Feet, and fired pitch'd Boards at 150. Each *Speculum* is moveable, so as, by the Help of 3 Screws, to be set to a proper Inclination for directing the Rays towards any given Point.
